1	A Novel Method for Handwritten Digit Recognition Using Image Processing and Neural Networks	Handwriting recognition is one of the compelling research works going on because every individual in this world has their own style of writing. MNIST data set is widely used for this recognition process and it has 70000 handwritten digits. We use Artificial neural networks to train these images and build a deep learning model.	<ul style="list-style-type: none"> • Random Forest, • J48 • Random Tree • Naive Bayes, • Support vector Machine, • Bayesian Network • Multilayer Perceptions 	<ul style="list-style-type: none"> • Optical Character Recognition (OCR) • Deep Learning, • Machine Learning • Artificial Neural Networks 	<p>The system not only produces a classification of the digit but also a rich description of the instantiation parameters which can yield information such as the writing style</p> <p>The generative models can perform recognition driven segmentation</p>

2	Handwritten Digit Recognition Using Image Processing and Neural Networks	It can detect handwritten digits from a scanned image of an input form by using Neural network technique.several data has been trained to neural network based AI engines to detect the image . handwritten digit will be given as sample input in to the system , the output array will automatically give the digit whose corresponding match value is detected.	<ul style="list-style-type: none">• Fourier transformation• Support Vector Machine (SVM)• Histogram	<ul style="list-style-type: none">• Artificial Neural network	It only requires one time training of the neural network whereas in cited methodologies whenever there is an image to process all steps are repeated again and again for image pre-processing

5	Intelligent handwritten digit recognition using artificial neural network	It was developed by using the method called Neural Network and Gradient descent back propagation algorithm. Neural Network consists of an input layer, hidden layer and an output layer. The input layer and the hidden layer are connected using weights. Gradient descent back propagation algorithm, it contains 4000 training samples and 1000 testing samples.	<ul style="list-style-type: none"> • Feed-forward Algorithm • Gradient descent back propagation algorithm • Neural Network • Optical Character Recognition (OCR) • pen 	Multilayer Perceptron (MLP) NeuralNetwork	The proposed system was proved efficient with an overall training accuracy of 99.32% and testing accuracy of 100%. Larger number of datasets to be trained in this process, it takes large amount of time to

6

A novel method for handwritten digit recognition using deep learning

- Convolution Neural
 - Deep Network
- Multi-Layer • Machine Perceptron Learning
- TensorFlow

By using the Convolution Neural Network, we can able to get an accuracy of 95.72%.

<p>The MNIST database has been used for that which is already divided into training set of 60,000 examples and test of 10,000 example. The training algorithm used is Convolution Neural Network. This will prepare the trained model which will be used to classify the digits present in the test data.</p>	<p>Sometimes it doesn't provide the appropriate solution based on input</p>
